

LVDT Transmitter v4 LVDT149

DESCRIPTION

The LVDT149 converts the displacement information from an LVDT sensor into a common process dc signal that can be used for measurement, display or control.

The LVDT149 provides an ac sine wave excitation to the primary winding and measures the two secondary winding signals (amplitude and phase). As the core moves from the null position, the differential in flux coupled to the two secondaries produces a voltage difference between them. The amplitude and phase information is measured by the LVDT149 and converted to a dc output that is proportional to the core movement.

Final calibration is trimmed using the front accessible OFFS and SPAN 15-turn trim adjustments. The output signal level is indicated by a green LED on front, giving a clear indication of module function, presence of signal and output loop closed (for current outputs only). All units are fitted with a 0.1 second filter. This filter constant can be increased or decreased if required. Various power supply choices are available ranging from 240Vac down to 8Vdc.

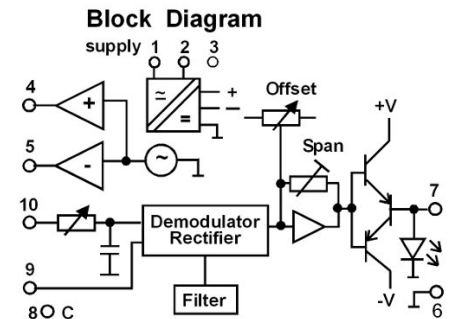

About the LVDT Sensor

The LVDT is a Linear Variable Differential Transformer that is used to measure very small displacement or any parameter that can be converted to linear movement. The LVDT consists of an insulated moving core that magnetically couples the primary winding on the bobbin to two opposing secondary windings. Because there is no physical contact between the movable core and coil structure, the LVDT has friction-less performance and essentially infinite mechanical life.
